

Corn Lights

Installation Steps

Disconnect All Power

An LED Corn Light replaces an enormous variety of high intensity discharge bulbs used for many different applications. These are found in an assortment of fixtures. While they are all wired slightly different, the conversion concept is the same. The LED wires direct line power. The old HID components must be bypassed. The end goal is to bring direct line power to the socket.

STEP 1
Remove bulb and open fixture.

STEP 2
Cut wires connected to ballast.

STEP 3
Connect direct line power to socket.

STEP 4
Close fixture and screw in LED corn light.
